Key:

Rx Plan = Non Medicare retirees and dependents enrolled in the CareFirst CVS Caremark Rx Plan
MRx Plan = Medicare retirees and dependents enrolled in the SilverScript Part D Rx Plan

How To Determine Your Bi-Weekly Prescription Cost

To determine your prescription drug cost in the City's (High Option or Standard Option) prescription drug plan, read the following categories along with the costs displayed on the front of this notice and complete the worksheet below. Choose the High Option or Standard Option column based on your Medical plan enrollment option. If you enroll in the CareFirst PPN Standard Option Medical Plan, then you can only elect the Standard Option Rx Plan. All other Medical Plan enrollment options are linked to the High Option Rx Plan.

- > Refer to **Table A** if you and all of your family members are Non Medicare. **Example:** Your family unit includes you and two dependents (spouse and children) all members are (**Non Medicare – Table A – Rx Level Tier 4 – Family**). Your Rx cost for you and your family members will be \$43.47 if you enroll in the Standard Option Rx Plan. Your total prescription drug cost of \$43.47 will be combined with your medical cost as a single payroll deduction from your biweekly pension check.

- > Refer to **Table B** if you and all of your family members (dependents) are Medicare eligible enrolled in Medicare Parts A and/or B. **Example:** Your family unit includes you and your spouse (**Both Medicare Eligible – Table B – MRx Tier 22 – Two Members enrolled in MRx**). Your MRx cost will be \$39.30 for both of you. Your total prescription drug cost of \$39.30 will be combined with your medical cost as a single payroll deduction from your biweekly pension check.

- > Refer to **Tables A and B** if your family has a combination of Non Medicare and Medicare members. You will have to add the cost of Rx and MRx level tiers from both Tables A & B to arrive at your total prescription drug cost that will be combined with your medical cost as a single payroll deduction from your biweekly pension check. Example: Your family unit includes you (Non Medicare – Table A – Tier 1 - Individual) and your spouse (Medicare – Table B – Tier 21 – One Member enrolled in MRx). Your Rx cost will be \$21.10 if you enroll in the High Option Rx Plan and your spouse's MRx cost will be \$19.65. Your total prescription drug cost of \$40.75 ($\$21.10 + \$19.65 = \40.75) will be combined with your medical cost as a single payroll deduction from your biweekly pension check.

- > Refer to **Tables B & C** if you (the retiree) are Medicare eligible enrolled in the MRx plan and your family members (dependents) are Non Medicare enrolled in the Rx plan. You will have to add the cost of Rx and MRx level tiers from both Tables B & C to arrive at your total prescription drug cost that will be combined with your medical cost as a single payroll deduction from your biweekly pension check. Example: Your family unit includes you (the retiree – Medicare – Table B – MRx Tier 21 – One Member enrolled in MRx) and your spouse, son and daughter (all Non Medicare – Table C – Rx Tier 11 – Spouse + Children enrolled in Rx). Your MRx cost will be \$19.65 and your Spouse + Children's Rx cost will be \$51.44 if you enroll in the High Option Rx Plan. Your total prescription drug cost of \$71.09 ($\$19.65 + \$51.44 = \71.09) will be combined with your medical cost as a single payroll deduction from your biweekly pension check.

Worksheet:

Table A	All Members Non Medicare	Level Tier Code: _____	Rx Cost: \$ _____
Table B	All Members w/ Medicare A and/or B	Level Tier Code: _____	Rx Cost: \$ _____
Table C	Dependents of Retirees in MRx	Level Tier Code: _____	Rx Cost: \$ _____

Total Prescription Drug Cost Per Pension Check: \$ _____

Note: Your total prescription drug cost will be combined with your medical cost as a single payroll deduction from your biweekly pension check.
